

Have you heard about PETG?

You can find a lot of polycarbonate sheets in our portfolio, but that is not all we do. We are focusing also on sheets from PETG (copolyester) resin. With special properties for special applications. You might already see it - GRIPHEN® is our brand name for transparent PETG sheets and GRIPHTECH® are our opaque PETG sheets.

Standard GRIPHEN® sheet provides great light transmittance and is mainly used for indoor applications and classified as FDA (for food contact applications). Another great advantage of GRIPHEN® is that predrying is not needed before thermoforming or hot line bending with maintained visual clarity and very good chemical resistance. The properties of PETG makes the sheets easy to fabricate - cold bending, routing, drilling, milling etc. We offer a wide range of clear sheets, opal white and transparent colours, as well as FROST possibility (satin look on both sides, up to 6 mm), GRIPHEN® AR (anti-reflective top side pattern) and all sheets can have a UV protection on both sides.

GRIPHTECH® sheets are available in thickness range from 1,5 mm up to 10 mm. Our colour matching service provides you exactly the colour you want. Standard lead time for colour matching a new colour is 2-3 weeks.

GRIPHTECH® sheets can be produced with both sides UV protection when needed.

PETG sheets are perfect for applications for advertisement, thermoforming, face shield protection, food displays, or in package industry.
